

Supporti in acciaio inossidabile

Stainless steel bearing units

1. Componenti dei supporti in acciaio inossidabile

I supporti **ISB® in acciaio inossidabile** sono costruiti in molteplici esecuzioni, con corpo esterno in acciaio inossidabile. I supporti sono forniti completi di cuscinetto anch'esso in acciaio inossidabile, dotato di anello esterno sferico che può oscillare nella corrispondente sede ricavata nel supporto, in modo tale da compensare qualsiasi difetto d'allineamento, eliminando le sollecitazioni tra albero e supporto. Il cuscinetto inserito nell'alloggiamento del supporto, è corrispondente per le sue caratteristiche costruttive interne ai cuscinetti della serie 62 o 63 secondo le tabelle ISO.

Su entrambi i lati del cuscinetto, sono montate delle guarnizioni di tenuta, studiate e particolarmente indicate per garantire una perfetta tenuta ed evitare così eventuali infiltrazioni di polvere. Tutti i cuscinetti sono pre-ingrassati e ri-lubrificabili, fatta eccezione per le serie: CB - RB - SA - SB, che sono lubrificati per tutto l'arco della loro vita.

Nel caso che i supporti debbano essere utilizzati in condizioni particolarmente critiche, come in ambienti dove operano aziende agricole, siderurgiche, fonderie, tutti i supporti possono essere forniti di coperchi di protezione supplementare sia chiusi che aperti, anch'essi costruiti in acciaio inossidabile.

1. Stainless steel bearing units components

ISB® stainless steel bearing units are built in multiple executions, always with stainless steel housings. The housing units are supplied complete with stainless steel ball bearing, equipped with spherical outer rings which can oscillate in its corresponding housing, in order to compensate any alignment defect, eliminating solicitations between the shaft and the housing. The insert bearing corresponds to the internal constructive characteristics of the 62 or 63 series according to the ISO tables. Specially designed resistance seals are located on both sides of the ball bearing, particularly designed to guarantee perfect resistance; this avoids any possible dust infiltration. All ball bearings are pre-greased and can be periodically refilled, except for the series: CB - RB - SA - SB, which are lubricated for their lifetime.

In case bearing units are used in particularly critical conditions, such as workplaces where agricultural companies, or iron and steel foundries operate, all housings can be supplied with supplementary protective covers, either opened or closed, built in stainless steel too.

Ingrassatore per lubrificazione

Grease nipple for lubrication

Doppia tenuta: lamierino di protezione più tenuta in gomma

Double protection: combination of steel and rubber seal

Foro di fissaggio del supporto

Bearing unit fixing hole

Superficie sferica orientabile

Self-aligning surface

Grano di fissaggio fornibile anche con bussola o collare eccentrico di fissaggio

Set screw fixing also available with eccentric collar or tapered adapter sleeve

Corona a un giro di sfere

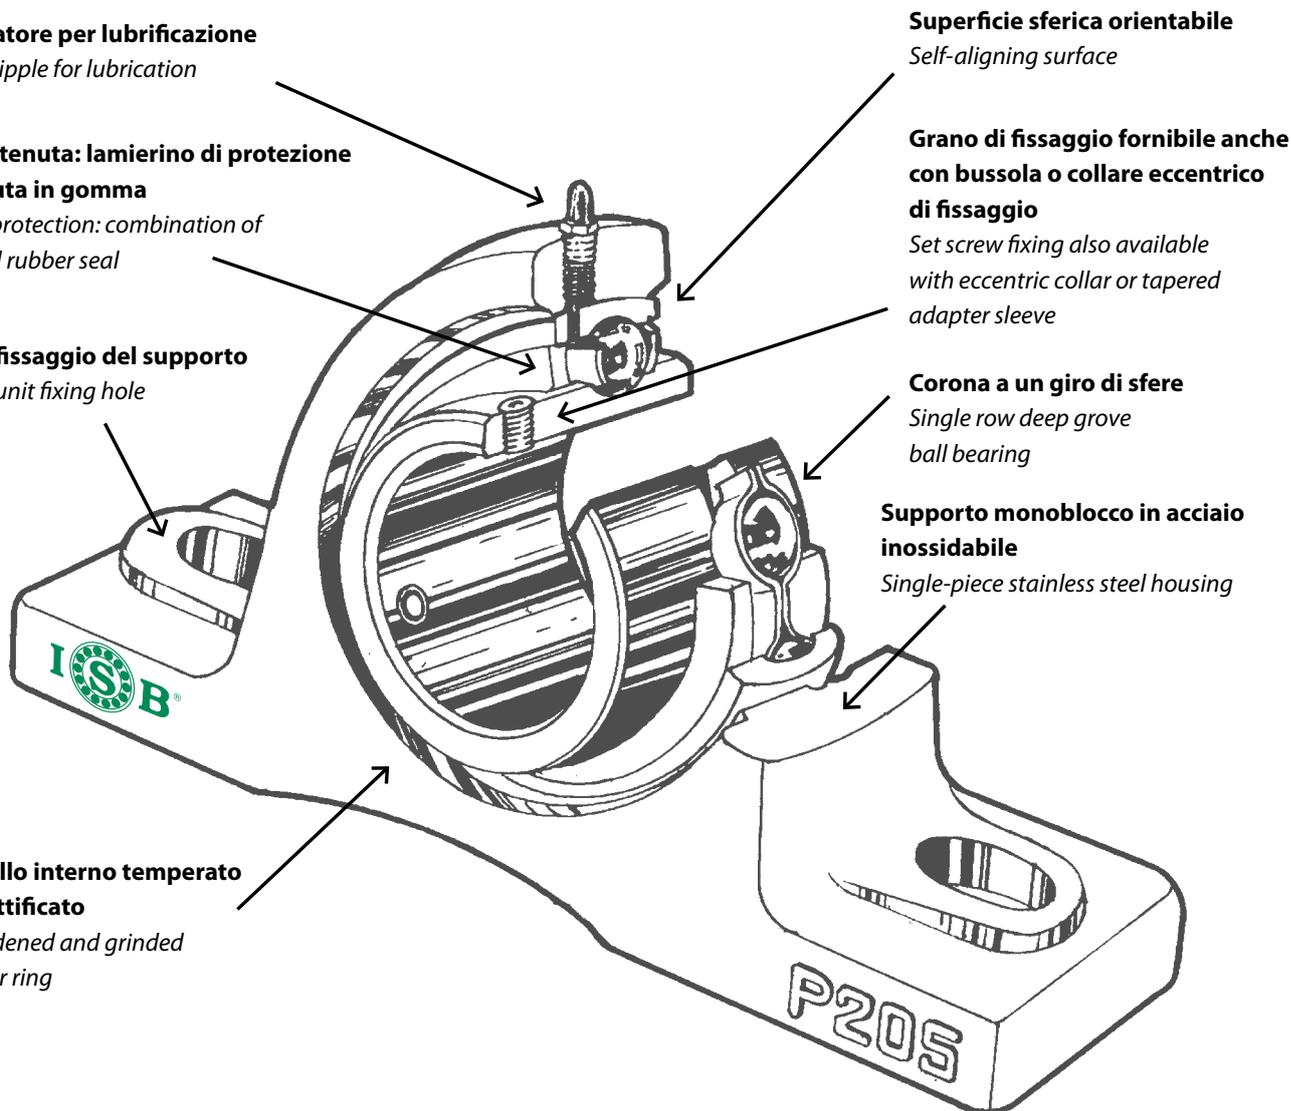

Single row deep groove ball bearing

Supporto monoblocco in acciaio inossidabile

Single-piece stainless steel housing

Anello interno temperato e rettificato

Hardened and grinded inner ring

2. Materiali utilizzati per la costruzione dei supporti in acciaio inossidabile

I supporti sono prodotti che possono essere considerati come dati dalla combinazione di un cuscinetto per inserti, allocato all'interno di una sede opportunamente sagomata: il programma ISB dei supporti in acciaio inossidabile prevede la possibilità di fornire sia il supporto completo che il solo insert bearing, entrambi realizzati in acciaio inossidabile.

Nello specifico:

- le sedi vengono realizzate in acciaio inossidabile AISI 304;
- nei cuscinetti per inserti ISB in acciaio inossidabile gli anelli esterni ed interni, i corpi volventi e le gabbie sono realizzati con le tipologie di materiale sottoindicate per conferire una maggiore resistenza all'acqua, al vapore, agli alcali ed in parte agli acidi;
- i cuscinetti, realizzati nella versione schermata, vengono forniti preingrassati con grasso Mobilgrease® FM222.

2. Materials used for the construction of stainless steel bearing units

Bearing units can be considered as the result of the combination of an insert bearing with a suitably shaped housing: the ISB program of stainless steel bearing units provides the possibility to supply the complete product and the insert bearing only, both made of stainless steel.

In particular:

- the housings are made of AISI 304 stainless steel;
- in ISB stainless steel insert bearings both rings, the rolling elements and the cages are made with the types of material listed below, in order to give greater resistance to water, steam, alkalis, and some acids;
- the insert bearings, designed in the sealed version, are supplied pre-greased with Mobilgrease® FM221.

Componenti del supporto <i>Bearing unit parts</i>	Tipo di acciaio INOX <i>Stainless Steel type</i>
Anelli / Rings	AISI 440C - AISI 420B
Sfere / Balls	AISI 440C
Schermi / Shields	AISI 304
Tenute / Seals	NBR
Sede / Housing	AISI 304

Si riportano di seguito le composizioni dei diversi tipi di acciaio inossidabile impiegati per la realizzazione dei componenti dei cuscinetti ISB:

Here below the compositions of the different types of stainless steel, used to make the components of ISB bearings:

Tipo acciaio INOX <i>Stainless Steel</i>	C%	Cr%	Si%	Mn%	S%	P%	Mo%	Ni%
AISI 440C	0,95 - 1,10	16-18	≤ 0,08	≤ 0,08	≤ 0,03	≤ 0,035	≤ 0,75	
AISI 420B	0,26 - 0,35	12-14	≤ 1	≤ 1,5	≤ 0,03	≤ 0,04		≤ 1
AISI 304C (304L)	≤ 0,07	17-19	≤ 1	≤ 2	≤ 0,03	≤ 0,035		8 - 11

Si riportano di seguito le caratteristiche del grasso Mobilgrease® FM222:

Here below the technical characteristics of the Mobilgrease® FM222 grease:

Mobilgrease FM222 proprietà / Properties	
Grado NLGI / NLGI Grade	2
Addensante / Thickener Type	Complesso di alluminio / Aluminum Complex
Colore, visual / Color, Visual	Bianco / White
Penetrazione, lavorata, 25° C, ASTM D 217 mm/10 / Penetration, Worked, 25° C, ASTM D 217, mm/10	280
Punto di goccia / Dropping Point, °C, ASTM D 2265	260
Viscosità dell'olio / Viscosity of Oil, ASTM D 445	
cSt @ 40° C / cSt @ 40° C	220
Variatione di consistenza per penetrazione, variazione per penetrazione lavorata dopo 100.000 colpi, ASTM D 1831, mm/10 / Penetration Consistency Change, 100,000 Stroke, Change from Worked Pen, ASTM D 1831, mm/10	+5
Test usura a 4 sfere / 4-Ball Wear Test, ASTM D 2266, Scar, mm	0.50
Test antiruggine, ASTM D 1743, valutazione / Corrosion Prevention, ASTM D 1743, Rating	Passa / Pass
Corrosione su rame / Copper Strip Corrosion, DIN 51811	1b

I materiali utilizzati per la realizzazione dei supporti in acciaio inossidabile nella versione aperta sono in grado di sopportare temperature massime di utilizzo di +100°C e temperature minime di -15°C in relazione all'impiego del materiale NBR con cui le tenute sono realizzate.

The materials used to produce stainless steel bearing units are able to withstand maximum operating temperatures of +100°C and minimum temperatures of -15°C in relation to the NBR material, which the seals are made of.

3. Designazione dei supporti in acciaio inossidabile

I supporti sono prodotti che possono essere considerati come la combinazione di un cuscinetto per inserti, allocato all'interno di una sede opportunamente sagomata: in relazione a questo aspetto, la designazione dei prodotti disponibili a programma ISB, può essere vista come la composizione della matrice riportata di seguito, delle due tipologie di prodotto.

3. Stainless steel bearing units designation

The bearing units can be considered as the combination of an insert bearing, placed into a suitably shaped housing: for this reason, the designation of the products available in the ISB program can be seen as the composition of the two types of product, according to the matrix shown below.

Supporto Housing	Tipologia - Type			
	 UC2.. UC3.. UCX..	 SA2..	 SB-RB2..	 U0
 P	UCP2.. - UCP3.. UCLP2.. - UCPX..	SAP	SBP	-

 PFL	BPFL..	BPFL-SA2..	BPFL-SB2..	-
 FT	BPFT..	BPFT-SA2..	BPFT-SB2..	-

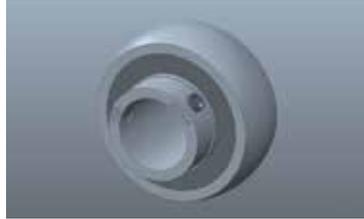

Entrando nel dettaglio della designazione, la sede cambia in funzione della tipologia, ovvero della forma, quindi della modalità di fissaggio alla piastra di supporto, e dei punti di ingrassaggio.

Le tipologie di cuscinetti per inserti differiscono invece principalmente per tipologia di bloccaggio dell'albero e per conformazione dell'anello interno, nello specifico:

Going into the detail of the designation, the housing changes the name according to the type, i.e. the shape, therefore the method of fastening to the support plate, and the greasing points.

The types of insert bearings differ mainly because of the type of the shaft locking system and because of the conformation of the inner ring, specifically:

- l'UC prevede il bloccaggio dell'albero mediante grani di fissaggio posizionati a 120° ed ha anello interno sporgente dalla parte opposta rispetto alla parte nella quale vengono allocati i grani;

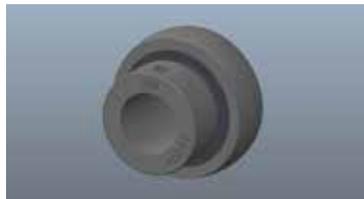

- *the UC locks the shaft by means of two set screws positioned at 120° and has an internal ring protruding from the opposite side of the one where the set screws are located;*

- L'HC prevede il bloccaggio dell'albero mediante collare eccentrico e grani di fissaggio ed ha anello interno sporgente dalla parte opposta rispetto alla parte nella quale viene allocato il collare eccentrico

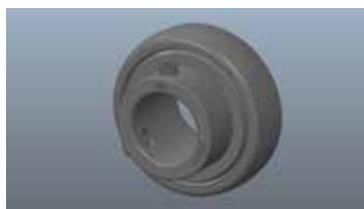

- *the HC locks the shaft by means of an eccentric collar and set screws and has an internal ring protruding from the opposite side of the one where the collar is located;*

- L'SA prevede il bloccaggio dell'albero mediante collare eccentrico e grani di fissaggio ed ha anello interno non sporgente dalla parte opposta rispetto alla parte nella quale vengono allocati i grani (quindi, su questo lato, ha lo stesso ingombro dell'anello esterno);

- *the SA locks the shaft by means of an eccentric collar and set screws and has an internal ring not protruding from the opposite side of the one where the set screws are located (therefore, on this side, it has the same height of the outer ring);*

- L'SB prevede il bloccaggio dell'albero mediante grani di fissaggio posizionati a 120° ed ha anello interno non sporgente dalla parte opposta rispetto alla parte nella quale vengono allocati i grani (quindi, su questo lato, ha lo stesso ingombro dell'anello esterno);

- *the SB locks the shaft by means of two set screws positioned at 120° and has an internal ring not protruding from the opposite side of the one where the set screws are located (therefore, on this side, it has the same height of the outer ring);*

- l'U0 è un cuscinetto per inserti con caratteristiche omologhe al cuscinetto SB ma di dimensioni di ingombro ridotte a pari diametro albero.

- *the U0 is an insert bearing with characteristics similar to the SB type, but with reduced overall dimensions for the same shaft diameter.*

La parte numerica conclusiva della denominazione di base del supporto trova allineamento con quella dei cuscinetti, motivo per cui il primo numero indica la serie dimensionale del cuscinetto per inserti, mentre le ultime due cifre rappresentano il diametro del foro secondo la regola riportata di seguito:

- 00 = diametro foro 10mm;
- 01 = diametro foro 12mm;
- 02 = diametro foro 15mm;
- 03 = diametro foro 17mm;
- 04 = diametro foro 20mm (cioè $20 : 5 = 04$);
- 05 = diametro foro 25mm (cioè $25 : 5 = 05$).

The final numerical part of the designation of the bearing unit is aligned to the one of the bearings, so the first number indicates the dimensional series of the insert bearing, while the last two numbers represent the bore diameter according to the following rule:

- *00 = bore diameter 10mm;*
- *01 = bore diameter 12mm;*
- *02 = bore diameter 15mm;*
- *03 = bore diameter 17mm;*
- *04 = bore diameter 20mm (ie $20 : 5 = 04$);*
- *05 = bore diameter 25mm (ie $25 : 5 = 05$).*

5. Tolleranze dei supporti in acciaio inossidabile

Poiché i supporti sono prodotti che possono essere considerati come la combinazione di un cuscinetto per inserti allocato all'interno di una sede ottenuta con processi produttivi differenti, le tolleranze di questi prodotti devono essere considerate separatamente, prendendo quindi in esame il cuscinetto e successivamente la sede.

5.1 Tolleranze dei cuscinetti per inserti in acciaio inossidabile

Le tolleranze dei cuscinetti e dei supporti sono state normalizzate a livello sia nazionale che internazionale in conformità alle norme JIS. I cuscinetti vengono in genere costruiti in classe di tolleranza standard

5. Stainless steel bearing units tolerances

Since bearing units are products that can be considered as the combination of an insert bearing placed into a housing, obtained with different production processes, the tolerances of these products must be considered separately, thus taking into consideration the bearing and subsequently the housing.

5.1 Stainless steel insert bearings tolerances

The tolerances of insert bearings and their housings have been normalized at both national and international levels, and conform to JIS norms. Generally, the insert bearings are produced according to standard tolerances.

d	diametro nominale del foro <i>nominal bore diameter</i>
Δd_{mp}	scostamento del diametro del foro dal valore nominale <i>deviation of bore diameter from nominal value</i>
V_{dp}	variazione del diametro del foro <i>bore diameter variation</i>
D	diametro nominale esterno <i>nominal outer diameter</i>
ΔD_{mp}	scostamento del diametro esterno medio dal valore nominale <i>deviation of the mean outer diameter from nominal value</i>
K_{ia}	concentricità di rotazione dell'anello interno nel cuscinetto completo (precisione radiale di rotazione) <i>concentricity radial run out of assembled bearing inner ring (run out radial precision)</i>
K_{ea}	concentricità di rotazione dell'anello esterno nel cuscinetto completo (precisione radiale di rotazione) <i>concentricity radial run out of assembled bearing outer ring (run out radial precision)</i>
ΔB_s	scostamento di una singola misura dell'altezza dell'anello interno rispetto alla dimensione nominale <i>inner ring single height deviation as regards to nominal dimension</i>
ΔC_s	scostamento di una singola misura dell'altezza dell'anello esterno rispetto alla dimensione nominale <i>outer ring single height deviation as regards to nominal dimension</i>

6. Coefficienti di carico

La scelta del cuscinetto volvente da inserire nell'applicazione viene condotta in funzione delle esigenze tecniche dell'applicazione che possono essere riassunte in:

- tipologia ed entità dei carichi agenti;
- durata;
- sicurezza d'esercizio.

In questa fase devono quindi essere presi in considerazione i coefficienti di carico statico e dinamico del cuscinetto che sono i parametri che permettono di condurre le valutazioni di idoneità del cuscinetto alle caratteristiche dell'applicazione.

6.1 Coefficiente di carico statico

In caso di basse velocità di rotolamento (inferiori a 10 giri al minuto), di ridotti movimenti oscillanti o nelle applicazioni stazionarie, viene tenuto in considerazione il coefficiente di carico statico di riferimento C_0 che viene calcolato in conformità alla norma ISO 76 e che viene definito come il carico stazionario esplicitosi sul cuscinetto che induce ad una deformazione permanente del corpo volvente e della pista di rotolamento pari a circa 1/10000 del diametro del corpo volvente (0,0001 dw). Quanto sopra vale anche per i cuscinetti volventi sottoposti ad ingenti carichi d'urto che si esplichino nel corso di una frazione di giro.

6.2 Coefficiente di carico dinamico

Il coefficiente di carico dinamico C esprime il carico massimo ammissibile agente sul cuscinetto atto a fornire una durata teorica pari ad 1.000.000 di giri e viene calcolato in conformità alla norma ISO 281. Tenendo in considerazione tale parametro è possibile calcolare il tempo di servizio necessario alla comparsa di segni di fatica dei materiali che dipende dal carico agente sul cuscinetto e dalla velocità di rotazione in esercizio.

6. Load ratings

The choice of the rolling bearing to be inserted in the application is done according to the technical requirements of the application itself, and can be summarized as:

- *type and entity of the loads charging the bearing;*
- *duration;*
- *operational safety.*

In this phase, the static and dynamic load ratings of the bearing must be considered, being the parameters that allow to evaluate the bearing suitability to the characteristics of the application.

6.1 Static load rating

In case of low rotating speeds (less than 10 revolutions per minute), of reduced oscillating movements or in stationary applications, the static load rating C_0 is taken into account; it is calculated in accordance with ISO 76 standard and is defined as the stationary load charging the bearing, inducing a permanent deformation of the rolling element and the raceway, equal to about 1/10000 of the diameter of the rolling element (0,0001 dw).

What above is also applicable to rolling bearings subjected to large shock loads that occur during one fraction of a turn.

6.2 Dynamic load rating

The dynamic load rating C expresses the maximum allowable load acting on the bearing, providing a theoretical life of 1,000,000 revolutions, and is calculated in accordance with ISO 281 standard. Taking this parameter in consideration, it is possible to calculate the necessary service time before the appearance of evidence of material fatigue, which depends on the load acting on the bearing and the operating rotation speed.

7. Carico ammissibile delle sedi in acciaio inossidabile

La capacità di carico dei supporti è determinata principalmente da due fattori:

- la forma
- la direzione del carico.

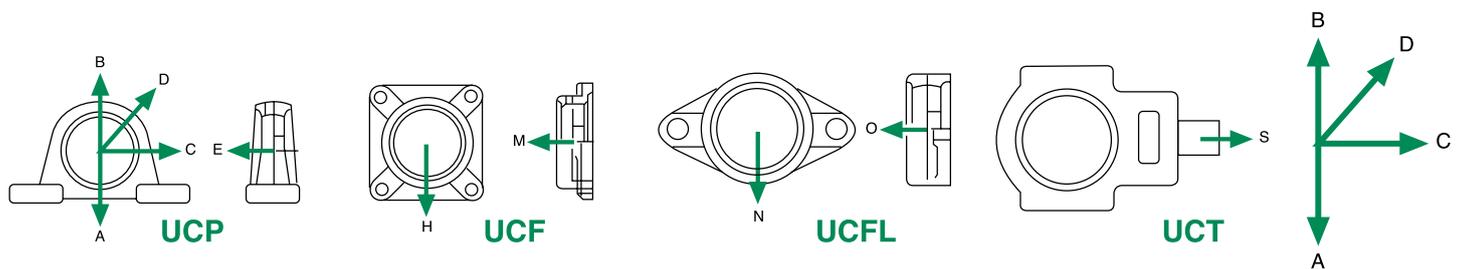

Visto che ogni supporto ha caratteristiche diverse nella forma, può risultare difficile calcolare le capacità di carico permesse. In tutti i casi è sempre opportuno prestare attenzione alla direzione della forza applicata, che può essere verso il basso, verso l'alto, orizzontale o assiale.

7. Stainless steel housings allowed load

The housing load is determined principally by two factors:

- the shape
- the direction of the load

As each housing has different characteristics in different shapes, it can be difficult to calculate the admitted load capacity. In any case, it is always helpful to consider the direction of the load applied. The direction can be upward, downward, horizontal or axial.

- A/H/N Direzione verso il basso
- B Direzione verso l'alto
- C/S Direzione in orizzontale
- D Direzione a 45°
- E/M/O Direzione assiale

- A/H/N Downward direction
- B Upward direction
- C/S Horizontal direction
- D 45° direction
- E/M/O Axial direction

8. Dimensionamento

La scelta del supporto viene condotta principalmente prendendo in esame le caratteristiche dimensionali di ingombro, il fissaggio, le caratteristiche dei carichi a cui il supporto è soggetto e la velocità di rotazione; queste caratteristiche sono spesso vincolate al progetto della macchina nel suo insieme e conseguentemente in molti casi la scelta del supporto da installare viene limitata ad un numero ristretto di tipologie.

9. Supporti sollecitati staticamente

I supporti non sottoposti a rotazione oppure soggetti a rotazioni saltuarie vanno dimensionati in base alla resistenza della sede ed alla capacità di carico statico C_0 del cuscinetto che rappresenta, secondo DIN ISO 76 un carico radiale costante C_{or} .

La resistenza della sede viene ottenuta mediante confronto del carico agente con il carico ammesso dalla sede in funzione della direzione del carico, opportunamente rimodulata prendendo in considerazione i coefficienti di sicurezza proposti di seguito:

8. Sizing

The choice of the bearing unit is mainly carried out by examining the characteristics of the overall dimensions, the positioning, the type of loads to which the bearing unit is subjected and the rotation speed; these features are often linked to the design of the machine as a whole: therefore, in many cases the choice of the bearing unit to be installed is limited to a short number of types.

9. Statically loaded bearing units

Bearing units, in which insert bearings are not subjected to rotation or to occasional rotation, must be sized according to the allowed load of the housing and to the insert bearing static load capacity C_0 which, according to DIN ISO 76 standard, represents a constant radial load C_{or} .

The verification of the housing is obtained comparing the acting load with the housing admitted load in function of the direction of the load, suitably remodulated taking into consideration the safety coefficients shown below:

Condizioni di carico <i>Load conditions</i>	Carico permanente <i>Permanent load</i>	Carico vibratorio <i>Vibratory load</i>	Carico improvviso <i>Unexpected load</i>
Coefficiente di sicurezza <i>Safety factor</i>	4	10	15

kN

La verifica statica del cuscinetto si esegue confrontando i carichi statici agenti sul cuscinetto ed il coefficiente di carico statico C_0 per calcolare il fattore di sicurezza statica dell'applicazione, definita come:

$$s_0 = C_0/P_0$$

dove:

s_0 = fattore di sicurezza statico

C_0 = coefficiente di carico statico di base [kN]

P_0 = carico statico equivalente sul cuscinetto [kN]

Alternativamente, è possibile affermare che il massimo carico P_0 che può agire sul cuscinetto si calcola moltiplicando il coefficiente di carico statico del cuscinetto per il coefficiente di sicurezza scelto; vengono proposti nella tabella di seguito i valori suggeriti per il fattore di sicurezza statico in funzione del tipo di applicazione:

The static verification of the insert bearing is performed by comparing the static loads acting on the bearing and the static load coefficient C_0 to calculate the static safety factor of the application, defined as:

$$s_0 = C_0/P_0$$

where:

s_0 = static safety factor

C_0 = basic static load rating [kN]

P_0 = equivalent static load on the bearing [kN].

Alternatively, it is possible to state that the maximum load P_0 which can act on a bearing is calculated by multiplying the static load rating of the bearing by the chosen safety factor; the suggested values for the static safety factor according to the type of application are shown in the table below:

CONDIZIONI D'ESERCIZIO OPERATING CONDITIONS	So
	Cuscinetti a sfere Ball bearings
Funzionamento silenzioso, con pochi urti ed esercizio normale con poche esigenze di silenziosità cuscinetti con bassi movimenti di rotazione <i>Silent functioning, few shocks and normal operation with little need of bearing silence with low rotation movements</i>	≥ 0,5
Esercizio normale con elevate esigenze di silenziosità di funzionamento <i>Normal functioning, high need of bearing silence in operation</i>	≥ 1
Funzionamento con accentuati carichi ad urto <i>Functioning with high shock loads</i>	≥ 2
Supporti con elevate esigenze di precisione e silenziosità di funzionamento <i>Supports with high precision need and silent working</i>	≥ 3

In caso di applicazioni caratterizzate da carichi combinati, ovvero carichi che presentano sia una componente assiale che una radiale agenti simultaneamente, si dovrà convertire il carico statico combinato in carico statico equivalente che viene definito come il carico radiale che, se applicato, causerebbe nel cuscinetto la stessa deformazione permanente indotta dalle reali condizioni di carico.

Il carico statico equivalente viene dato dalla formula:

$$P_0 = X_0 Fr + Y_0 Fa$$

dove:

P₀ consiste nel carico statico equivalente, espresso in N;

Fr rappresenta la componente radiale del carico statico di entità maggiore, espressa in N;

Fa rappresenta la componente assiale del carico statico di entità maggiore, espressa in N;

X₀=0.6 rappresenta il fattore di carico radiale;

Y₀=0.5 rappresenta il fattore di carico assiale.

In case of applications characterized by combined loads, i.e. loads that have both an axial and a radial component acting simultaneously, the combined static load must be converted into an equivalent static load which is defined as the radial load which, if applied, would cause in the bearing the same permanent deformation induced by the real load conditions. The equivalent static load is given by the formula:

$$P_0 = X_0 Fr + Y_0 Fa$$

where:

P₀ represents the equivalent static load, expressed in N;

Fr represents the radial component of the static load of greater entity, expressed in N;

Fa represents the axial component of the static load of greater entity, expressed in N;

X₀=0.6 represents the radial load factor;

Y₀=0.5 represents the axial load factor.

10. Supporti sollecitati dinamicamente

I supporti sono sollecitati dinamicamente quando un anello ruota rispetto all'altro sotto carico e pertanto il termine "dinamico" non si riferisce all'effetto del carico ma alle condizioni di funzionamento del cuscinetto. Quando si dimensionano i supporti, ovvero quando si calcola la durata teorica, si assume una sollecitazione dinamica quando la velocità di rotazione n ammonta ad almeno 10 giri al minuto.

Una volta eseguita la verifica statica della sede, la durata dei cuscinetti viene definita come il numero di giri o il numero di ore di funzionamento che il cuscinetto è in grado di sopportare prima che compaiano i primi segni di fatica su uno dei suoi anelli, sulla pista di rotolamento o sugli elementi volventi. Ove si voglia tenere in considerazione solamente la fatica nelle superfici di lavoro del cuscinetto, si dovranno osservare le seguenti condizioni:

- le forze e le velocità tenute in considerazione per la valutazione del cuscinetto dovranno corrispondere a quelle esplicitate alle reali condizioni di esercizio;
- durante l'intero periodo di esercizio dovrà essere assicurata un'adeguata lubrificazione;
- l'esperienza dimostra come il cedimento di molti cuscinetti sia da attribuirsi a cause diverse dalla fatica, quali: scelta di un cuscinetto di tipo inadeguato, difetti di funzionamento o di lubrificazione, presenza di particelle estranee nel cuscinetto, od altro.

11. Durata teorica

La durata teorica nominale di un cuscinetto consiste nel calcolo della durata di esercizio valutata con un grado di affidabilità pari ad almeno il 90% e pertanto la durata media di un gruppo di cuscinetti omologhi può essere di molto superiore alla durata nominale calcolata. La durata a fatica nominale viene calcolata in accordo alla ISO 281 e viene espressa con L10 (milioni di giri) o L10h (ore di esercizio). Il valore L10 potrà essere calcolato avvalendosi dell'equazione:

$$L10 = (C/P)^p$$

dove:

L10 corrispondente alla durata a fatica nominale, espressa in milioni di giri;

C corrispondente al carico dinamico del cuscinetto, espresso in N;

P corrispondente al carico dinamico equivalente sul cuscinetto, espresso in N;

^p corrispondente all'esponente di durata dell'equazione, con valore P=3 per i cuscinetti a sfere.

Per i cuscinetti che operano a velocità costante, la durata a fatica nominale, espressa in ore di funzionamento, potrà essere calcolata con la presente equazione:

$$L10h = (1.000.000 / n \cdot 60) \cdot (C / P)^p$$

dove n corrisponde alla velocità di rotazione, espressa in giri/minuto.

10. Dynamically loaded bearing units

Bearing units are dynamically loaded when one ring rotates relative to the other under load, so the word "dynamic" does not refer to the load but to the operating conditions of the bearing. During the calculation of the theoretical life of the bearing, a load is assumed to be dynamic when the rotation speed of the bearing is higher than 10 revolutions per minute. After the static verification of the housing, the insert bearing life is defined as the number of revolutions, or working hours, that the bearing is able to withstand before the first signs of fatigue appear on one of its rings, raceway or rolling elements. If only the fatigue in the working surfaces of the bearing is to be considered, the following conditions must be observed:

- *loads and speeds taken in consideration for the evaluation of the bearing must correspond to those occurring under real operating conditions;*
- *adequate lubrication must be ensured during the whole working time;*
- *experience shows that the failure of many bearings is due to causes different from fatigue, such as: choice of an inappropriate type of bearing, functioning or lubrication defects, presence of foreign particles in the bearing, or other.*

11. Theoretical duration

The theoretical nominal duration of a bearing consists in the calculation of the service life, evaluated with a degree of reliability equal to at least 90% and therefore the average life of a group of homologous bearings can be much higher than the calculated nominal life. The nominal fatigue life is calculated according to ISO 281 and is expressed as L10 (million revolutions) or L10h (operating hours). The L10 value can be calculated using the equation:

$$L10 = (C/P)^p$$

where:

L10 corresponding to the nominal fatigue life, expressed in millions of revolutions;

C corresponding to the dynamic load of the bearing, expressed in N;

P corresponding to the equivalent dynamic load of the bearing, expressed in N;

^p corresponding to the exponent of duration of the equation, with the value P=3 for ball bearings.

For bearings operating at constant speed, the nominal fatigue life, expressed in operating hours, can be calculated with this equation:

$$L10h = (1.000.000 / n \cdot 60) \cdot (C / P)^p$$

where n corresponds to the rotation speed, expressed in revolutions/minute.

I cuscinetti sono spesso soggetti a carichi combinati, ovvero carichi che presentano sia una componente assiale che una radiale agenti simultaneamente, motivo per cui, per eseguire il calcolo della durata teorica del cuscinetto, si dovrà convertire il carico dinamico combinato in carico dinamico equivalente che viene definito come il carico radiale costante in dimensione e direzione per i cuscinetti radiali che, se applicato, determina una durata teorica del cuscinetto omologa a quella del carico reale. Il carico dinamico equivalente viene dato dalla formula:

$$P = X Fr + Y Fa$$

dove:

- P consiste nel carico dinamico equivalente, espresso in N;
- Fr rappresenta la componente radiale del carico dinamico di entità maggiore, espressa in N;
- Fa rappresenta la componente assiale del carico dinamico di entità maggiore, espressa in N;
- X rappresenta il fattore di carico radiale;
- Y rappresenta il fattore di carico assiale.

La determinazione dei fattori di carico X ed Y segue la ISO 281 e viene tradotta nella tabella di seguito:

Bearings are often subjected to combined loads, i.e. loads that have both an axial and a radial component acting simultaneously, which is why, in order to calculate the theoretical bearing life, the combined dynamic load must be converted into an equivalent dynamic load, that is defined as the constant radial load in entity and direction for radial bearings which, if applied, determines a theoretical life of the bearing homologous to the one of the real load.

The equivalent dynamic load is given by the formula:

$$P = X Fr + Y Fa$$

where:

- P consists of the equivalent dynamic load, expressed in N;*
- Fr represents the radial component of the dynamic load of greater entity, expressed in N;*
- Fa represents the axial component of the dynamic load of greater entity, expressed in N;*
- X represents the radial load factor;*
- Y represents the axial load factor.*

The determination of the X and Y load factors follows ISO 281 standard and is transcribed into the table below:

F _a /C ₀	e	F _a /F _r ≤ e		F _a /F _r > e	
		X	Y	X	Y
0.014	0.19	1	0	0.56	2.30
0.028	0.22				1.99
0.056	0.26				1.71
0.084	0.28				1.55
0.110	0.30				1.45
0.170	0.34				1.31
0.280	0.38				1.15
0.420	0.42				1.04
0.560	0.44				1.00

12. Idoneità alla velocità

La velocità massima raggiungibile dai cuscinetti per inserti rappresenta la massima velocità del sistema in cui il cuscinetto viene inserito, parametro questo che viene determinato inizialmente dalla velocità di riferimento termico e, in seconda battuta, dalla tolleranza dell'albero scelta dall'utilizzatore finale.

In relazione a quanto sopra, si riportano di seguito le tabelle relative alla velocità massima del cuscinetto per inserti in funzione della tolleranza scelta per l'albero:

12. Speed suitability

The maximum speed that an insert bearings can reach represents the maximum speed of the system in which the bearing is placed, a parameter that is initially determined by the thermal reference speed, and secondly, by the shaft tolerance chosen by the final user.

For what above, here below the tables relating to the maximum speed of the insert bearings according to the tolerance chosen for the shaft are shown:

Tipo Type	Diametro Diameter	Tolleranza max. ammissibile e n. giri Max tolerance and rpm.

SA2 INOX Serie leggera - Light duty

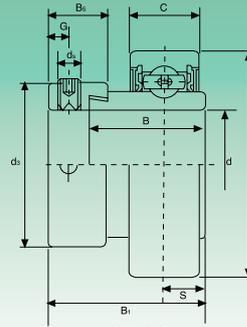

Suffisso UNF: Misure in pollici dei grani di bloccaggio
UNF suffix: inch sizes set screws

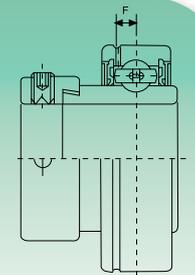

SA 2
anello esterno sferico
outer spherical ring

SA 2S
anello esterno sferico,
con gola di lubrificazione
outer spherical ring,
with relubrication groove

SA 2C
anello esterno cilindrico
outer cylindrical ring

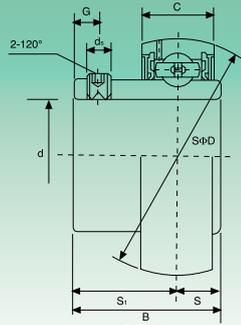

SA 2CS
anello esterno cilindrico,
con gola di lubrificazione
outer cylindrical ring,
with relubrication groove
